Animals - Vaccine Ingredients Censored: 
Just Amputate Their Limbs or Tails to Keep The Cancer

FDA reviewed the information requirements of the Animal Drug Regulations and determined that specification of ingredients other than ‘active’ ingredients is not needed. Under the Federal Food, Drug, and Cosmetic Act and under Authority delegated to the Commissioner of Food and Drugs and re-delegated to the Centre for Veterinary Medicine, 21 CFR part 522 is amended as follows: PART 522—IMPLANTATION OR INJECTABLE DOSAGE FORM NEW ANIMAL DRUGS 1. § 522.2100 [Amended]. Section 522.2100 Selenium, vitamin E injection is amended in paragraph (a)(1) by removing, “250 milligrams polyoxyethylated vegetable oil, and 2.0 percent benzyl alcohol, and water for injection”; in paragraph (b)(1) by removing, “100 milligrams of polyoxyethylated vegetable oil, 1:10,000 thimerosal, and water for injection”; and in paragraphs (c)(1), (d)(1), and (e)(1) by removing, “250 milligrams polysorbate 80, 2 percent benzyl alcohol, water for injection q.s.” Dated: May 11, 1999.

Purdue University is a Public Research University, Indiana, USA... The Purdue studies found that vaccinated dogs had developed autoantibodies to their own DNA. Did the alarm bells sound? Did the scientific community call a halt to the vaccination programme? No. Instead, they stuck their fingers in the air, saying more research is needed to ascertain whether vaccines can cause genetic damage... Meanwhile, the ‘study dogs' were found good homes, but no long-term follow-up has been conducted.

At around the same time, the American Veterinary Medical Association (AVMA) Vaccine-Associated Feline Sarcoma Task Force initiated several studies to find out why 160,000 cats each year in the USA develop terminal cancer at their vaccine injection sites.(3) The fact that cats can get vaccine-induced cancer has been acknowledged by veterinary bodies around the world, and even the British Government acknowledged it through its Working Group charged with the task of looking into Canine and Feline vaccines 4) following pressure from Canine Health Concern. What do you imagine as the advice of the AVMA Task Force, Veterinary bodies and Governments? 

"Carry on vaccinating until we find out why vaccines are killing cats, and which cats are most likely to die." (Same as the instructions for Humans).

In America, in an attempt to mitigate the (vaccine cancer) problem, they're vaccinating cats in the tail or leg so they can amputate when cancer appears. Great advice if it's not your cat amongst the hundreds of thousands on the "oops" list... But other species are okay - right? Wrong! In August 2003, the Journal of Veterinary Medicine carried an Italian study which showed that dogs also develop vaccine-induced cancers at their injection sites.(5) We already know that vaccine-site cancer is a possible sequel to Human vaccines, too, since the Salk Polio vaccine was said to carry a monkey retrovirus (SV40 - from cultivating the vaccine on monkey organs) that produces inheritable cancer. SV40 keeps turning up in human cancer sites.

It is also widely acknowledged that vaccines can cause a fast-acting, usually fatal, disease called Autoimmune Haemolytic Anaemia (AIHA). Without treatment, and frequently with treatment, individuals can die in agony within a matter of days. Merck, a multinational vaccine manufacturer, states in ‘The Merck Manual of Diagnosis and Therapy' that 'autoimmune haemolytic anaemia' may be caused by modified live-virus vaccines, as do Tizard's Veterinary Immunology (4th edition) and the Journal of Veterinary Internal Medicine.(6) The British Government's Working Group, despite being staffed by vaccine-industry consultants who say they are independent, also acknowledged this fact. However, no one warns the pet owners before their animals are subjected to an unnecessary 'booster,’ and very few owners are told why after their pets die of AIHA.

A Wide Range of Vaccine-induced Diseases: We also found some worrying correlations between vaccine events and the onset of Arthritis in our 1997 survey. Our concerns were compounded by research in the Human field. The New England Journal of Medicine, for example, reported that it is possible to isolate the Rubella virus from affected joints in children vaccinated against Rubella. It also told of the isolation of viruses from the peripheral blood of women with prolonged Arthritis following vaccination.(7)

Then, in 2000, CHC's findings were confirmed by research which showed that Polyarthritis and other diseases like Amyloidosis, which affects organs in dogs, were linked to the combined vaccine given to
There is a huge body of research, despite the paucity of funding from the vaccine industry, to confirm that vaccines can cause a wide range of Brain and Central Nervous System damage... Merck itself states in its Manual that vaccines (i.e., its own products) can cause Encephalitis (brain inflammation / damage). In some cases, Encephalitis involves lesions in the Brain and throughout the Central Nervous System. Merck states that "examples are the encephalitides following measles, chickenpox, rubella, smallpox vaccination, vaccinia, and many other less well defined viral infections."

"Paresis" is listed in Merck's Manual as a symptom of Encephalitis. This is defined as muscular weakness of a neural (Brain) origin, which involves partial or incomplete paralysis resulting from lesions at any level of the descending pathway of the brain. Hind limb paralysis is one of the potential consequences. Encephalitis, incidentally, is a disease that can manifest across the scale from mild to severe, and can also cause sudden death.

Organ failure must also be suspected when it occurs shortly after a vaccine event. Dr. Larry Glickman, who spearheaded the Purdue research into post-vaccination biochemical changes in dogs, wrote in a letter to Cavalier Spaniel breeder Bet Hargreaves: "Our ongoing studies of dogs show that following 'routine' vaccination, there is a significant rise in the level of antibodies dogs produce against their own tissues. Some of these antibodies have been shown to target the Thyroid gland, Connective Tissue such as that found in the valves of the heart, Red Blood Cells, DNA, etc. I do believe that the heart conditions in Cavalier King Charles Spaniels could be the end result of repeated immunisations by vaccines containing tissue culture contaminants that cause a progressive immune response directed at connective tissue in the heart valves. The clinical manifestations would be more pronounced in dogs that have a genetic predisposition [although] the findings should be generally applicable to all dogs regardless of their breed."

Meanwhile, please join the far queue to place your dog, cat, horse and child on the 'Russian Roulette' wheel - Because a Corporate Scientist says you Should.
