

5G_Babies_born_with_no_hands_in_Arena_Park_in_Gelsenkirchen_Germany

Received via email on 5 November 2019

Hi friend

This morning, we learned about a very disturbing news development coming out of Germany related that won't be getting much coverage here in the United States.

In 2017, the city of Gelsenkirchen partnered with the Chinese company, Huawei, to create an Open Innovation Lab in the city's Arena Park as a "showcase", "testbed", and platform "hub" for rolling out 5G technology to an entire continent of 750M people and beyond.

We found the weblinks showing that the Open Innovation Lab was fully operational in Arena Park in Gelsenkirchen at least between [August 8, 2018](#), and [February 28, 2019](#).

The most disturbing part? European media has been reporting for over a month about three babies born with missing hands in Gelsenkirchen between June 2019 and September 2019. A fourth incident was later reported from a neighboring town. None of this would have come to light if the mid-wife for one of the births hadn't spoken out.

Thanks to Sonja Ligget-Igelmund, the mid-wife, who first made these initial cases public.

Although there is no iron-clad conclusion linking these defect clusters to 5G, we are certain an environmental toxin is somehow involved. Clusters like these are becoming common everywhere! For your review, we have collected the links [here](#).

Consider that if a "testbed" can happen in Germany without wider public knowledge or consent, it could happen anywhere. We hope we are wrong about the link between the reported defects and untested 5G technology. Or if clearer evidence is established, we'd like to believe that governments or corporations would stop the roll-out of such a hazard.

Realistically, it would be wise to prepare for the worst and get your family protected now.
